                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                nuclear localization signal.
SIMILARITY: Belongs to the actin-binding proteins ADF family
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              FUNCTION: Controls reversibly actin polymerization and depolymerization in a pH-sensitive manner. It has the ability bind G- and F-actin in a 1:1 ratio of cofilin to actin. It is major component of intranuclear and cytoplasmic actin rods:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   PTM: The phosphorylation of Ser-24 may

"Structure, expression, and evolution of guinea pig ser

component and C-reactive protein.";

J. Biochem. 113:277-284(1993).

1-- FUNCTION. Displays several functions associated wit

it promotes agglutination, bacterial capsular swell

phagocytosi and complement fixation through its cal

binding to phosphorylcholine. Can interact with DNA

and may scavenge nuclear material released from dam

circulating cells (By similarity).

-!- SUBUNIT: Homopentamer. Pentaxin (or pentraxin) have

arrangement of 5 noncovalently bound subunits (By s:

-!- SUBCELLULAR LOCATION: Secreted.

-!- TISSUE SPECIFICITY: Found in plasma.

P48199;
                                                             it promotes agglutination, bacterial capsular swelling, phagocytosi and complement fixation through its calcium-dependent binding to phosphorylcholine. Can interact with DNA and histones and may scavenge nuclear material released from damaged circulating cells (By similarity).

-I SUBUNIT: Homopentamer. Pentaxin (or pentraxin) have a discoid arrangement of 5 noncovalently bound submits. Two of the five chains form a dimer linked by two interchain disulfide bonds located in the C-terminal heptapeptide and specific to rat CRP.
-I SUBCELULAR LOCATION: Secreted.
-I TISSUE SPECIFICITY: Found in plasma.
-I PTM: The last two cysteines are involved either in interchain disulfide bonds or in an intrachain bond of January 2003; WMW="http://www.expasy.org/spotlight/NOTE=Issue 30 of January 2003; WMW="http://www.expasy.org/spotlight/articles/sptlt030.html".

(er) Worm Breeder's Gazette 15(1):54(1997).

-I- FUNCTION: Nematode cuticles are composed largely of collagen-like proteins. The cuticle functions both as an exoskeleton and as a barrier to protect the worm from its environment.

-I- SUBUNIT: Collagen polypeptide chains are complexed within the cuticle by disulfide bonds and other types of covalent cross-links.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Thacker C

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               DNA rings, including catenanes and knotted rings. CATALYTIC ACTIVITY: ATP-dependent breakage, passa of double-stranded DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                  SIMILARITY: Belongs to the type II topoisomerase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                         breakage and rejoining; the B chain enzyme forms an A2B2 tetramer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   SUBUNIT: Made up of two chains. The A chain is breakage and rejoining; the B chain catalyzes A
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            FUNCTION: DNA gyrase negatively supercoils closed circular double-stranded DNA in an ATP-dependent manner and also catalyzes the interconversion of other topological isomers of double-stranded
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  _TaxID=781;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             409 igbygb

Submitted (FEB-2003) to the EMBL/GenBank/DDBJ databases.
-i- FUNCTION: DNA gyrase negatively supercoils closed circular double stranded DNA in an ATP-dependent manner and also catalyzes the interconversion of other topological isomers of double-stranded DNA rings, including catenanes and knotted rings (By similarity) DNA rings.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              TIGRFAMS; TIGR01059; gyrB; 1.

Y. Bacteriol. 186:5842-5855 (2004).

CC :- FUNCTION: DNA gyrase negatively supercoils closed circular double-
cc stranded DNA in an ATP-dependent manner and also catalyzes the
cc interconversion of other topological isomers of double-stranded
CC :- CATALYTIC ACTIVITY: ATP-dependent breakage, passage and rejoining
CC :- SIMILARITY: Belongs to the type II topoisomerase family.

CC :- SIMILARITY: Belongs to the type II topoisomerase family.

CC :- SIMILARITY: Belongs to the type II topoisomerase family.
